This important new book addresses a major policy question regarding the solid waste crisis: should municipalities charge households user fees for solid waste services? In her study of this issue, Professor Jenkins draws on a unique data set which relates the quantities of waste discarded and the prices charged to households for waste services in nine US communities.

‘In this admirable volume Jenkins utilises a unique data set relating to waste generation, composition, and collection in a range of communities in the US, in order to investigate the efficacy of user fees... a clearly written and technically competent piece of applied environmental economics, it is to be recommended.’
