Economics and Biology

The International Library of Critical Writings in Economics series

Edited by Geoffrey M. Hodgson, Institute for International Management, Loughborough University London, UK

Economics and Biology is a collection of key essays on the relationship between economics and biology. As the limitations of the mechanistic metaphor in economics are increasingly recognized, this volume explores the potential for the use of evolutionary and other ideas from the science of biology. Topics covered include evaluations of mechanistic and biological analogies in economics in the Darwinian revolution, the use of biology in Alfred Marshall’s economics, the concepts of optimisation and rationality in an evolutionary context and the inspirations that biology may offer for modern economics.

‘One very obvious positive feature of volumes like this one is the range of views that can be accessed by the reader, the facsimile format preventing editorial touches aimed at bringing them into line.’

– John Laurent, Griffith University, Australia

‘This very informative collection can be used as a reference book, or – with the editor’s introduction – even as an introductory text.’

– Thomas Wagner, Kyklos
